Business : E-commerce retailer with Auto Picking System

Outline

We have considered an E-commerce organization with a centralized warehousing and distribution system and uses automatic picking of stock. The model of business and the processes has been laid out here based on few of our real life knowledge derived from our past years of experience in Supply chain functions.

Business Rules

1. One company can have many warehouses but all the warehouses of a company will be related to only that company.

Warehouse is a physical location for storing goods which are then shipped to the customers. Multiple warehouses are normally used for efficient distribution in E-commerce business.

2. One warehouse may contain many products and one product can be kept at many warehouses.

Warehouses are normally huge in size and stores multiple products in high numbers

3. One truck may contain many products and one product can be in many trucks.

Trucks are used to transport the goods and hence there may be multiple products in a truck

4. One product can be ordered by many customers and one customer can order many products.

Customers buy products through orders made through the websites in E-commerce. So the customer may have multiple products in the same order as they will be buying it at once.

5. One order can contain only one customer but one customer can make many orders

Customers are free to make multiple orders. But one order number will be unique to a customer who makes it.

6. One supplier can give many products and one product can be supplied by many suppliers

In the industry, most organizations maintain multiple suppliers for the same product and multi products for one supplier. This is a practice to reduce the risk from dependency on a single supplier.

7. Central Distribution Centre delivers items to many warehouses and one warehouse can receive items from the Central Distribution Centre only.

Some big organizations use the concept of a Central Distribution Center to make the supply chain efficient. These Central Distribution Centers collect shipments from Suppliers, store them and then distribute them to other warehouses. This is a practice to achieve logistics efficiency and avoid sales loss.

8. One warehouse may have many employees but one employee may work in only one warehouse.

Warehouses, as mentioned earlier, have numerous products and hence need many people to handle it. Even Though we have considered the organization to be the one having automatic inventory picking, there will be people who monitors it, manage the warehouse and other supporting departments

9. One inventory location will only have one product and all products have an inventory location

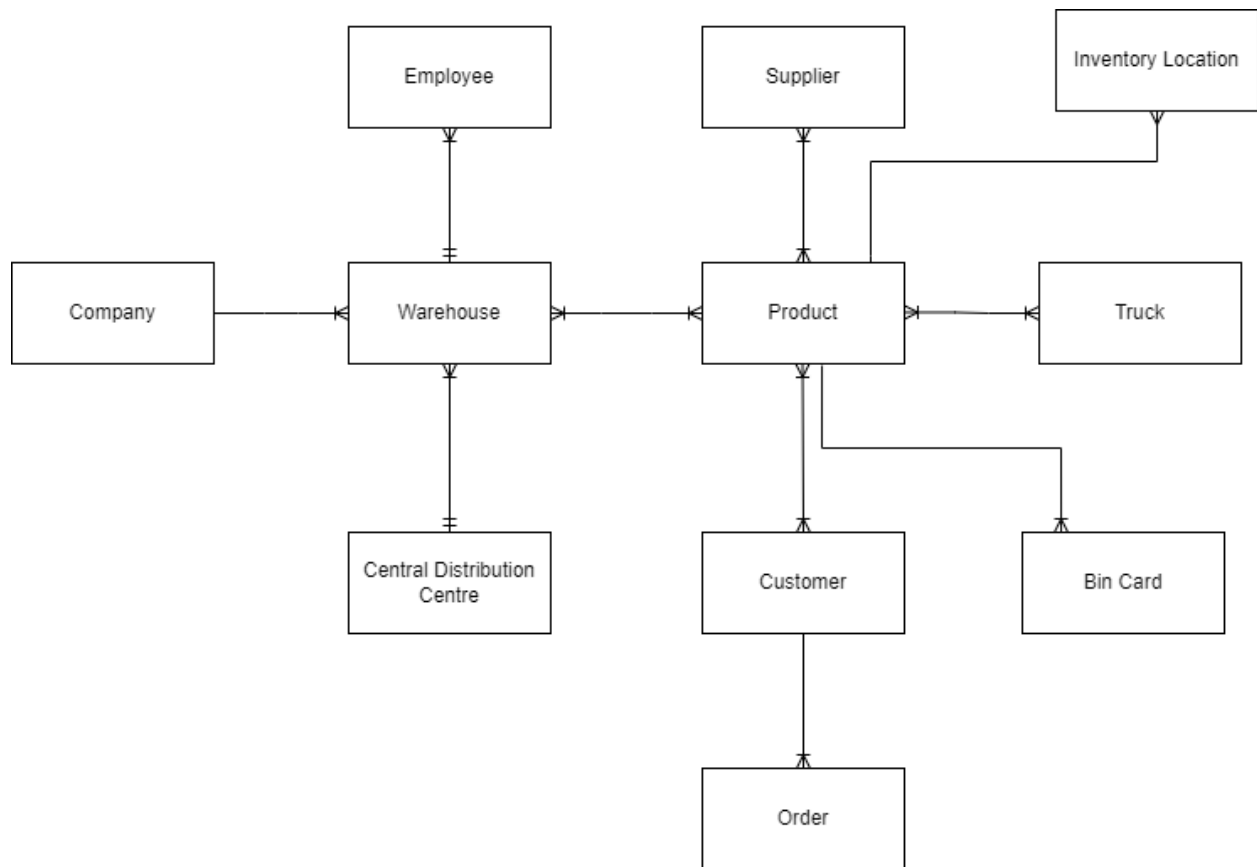

Since the automatic picking has been considered, inventory locations are always reserved to a product to ensure errorless and fast picking. A particular product will always be stored in one location.

10. One bin card can be assigned to one product but many products will have the same bin card.

Bin cards are tags used to be placed over lots to get a broad idea about the number of products and variety of products in it. In some industries they even use to refer to the purchase order number in it to identify the order against which it has been received. These tags are used for easy identification of stock, inventory counting and insurance purposes.

(109, 'F222', 'Kevin', 'Adams', 'Male', '900 Main Street, Toronto, Ontario', '990-000-1111', 'Toronto', 'Ontario'),
(110, 'G223', 'Katherine', 'Cooper', 'Female', '1000 Elm Street, Ottawa, Ontario', '1000-111-1111', 'Ottawa', 'Ontario');
```

The screenshot shows the same Microsoft SQL Server Enterprise Manager interface, but with the Messages pane at the bottom. The Messages pane displays the following information:

```
(10 rows affected)
(4 rows affected)
(2 rows affected)
(14 rows affected)
(8 rows affected)
(19 rows affected)
(19 rows affected)

Query executed successfully.
```

Meaningful Analytical Findings

1. Average Age of Employees

The screenshot shows the Microsoft SQL Server Management Studio interface. The Object Explorer on the left displays the database structure, including tables like `dbo.Employees`. The SQL Query window in the center contains the following query:

```
SELECT AVG(Emp_Age) AS average_age_of_employees
FROM dbo.Employees;
```

The Results pane at the bottom shows the output of the query:

average_age_of_employees
29

The status bar at the bottom indicates "Query executed successfully." and "1 rows".

2. Number of employees per department

The screenshot shows the Microsoft SQL Server Management Studio interface. The Object Explorer on the left displays the database structure, including tables like `dbo.Employees`. The SQL Query window in the center contains the following query:

```
SELECT Emp_Department, COUNT(Employees_ID) AS employee_count
FROM dbo.Employees
GROUP BY Emp_Department;
```

The Results pane at the bottom shows the output of the query:

Emp_Department	employee_count
Customer Service	1
Finance	1
HR	1
IT	1
Marketing	1
Sales	1
Warehouse	4

The status bar at the bottom indicates "Query executed successfully." and "7 rows".

3. Retrieve Order Details with Customer Information

The screenshot shows the Microsoft SQL Server Management Studio interface. The query editor contains the following SQL code:

```
SELECT o.order_id, o.order_code, c.first_name
FROM dbo.orders o
INNER JOIN dbo.customers c ON o.customer_id = c.customer_id;
```

The query results are displayed in a table with the following data:

order_id	order_code	first_name
1	A101	David
2	B102	David
3	C103	Erica
4	D104	Jason
5	A105	Michael
6	B106	Michelle
7	C107	Daniel
8	D108	Stephanie
9	A109	Kevin
10	B110	Erica
11	C111	Sarah

The status bar at the bottom indicates that the query was executed successfully and returned 19 rows.

4. Retrieve Products and Their Associated Suppliers

The screenshot shows the Microsoft SQL Server Management Studio interface. The query editor contains the following SQL code:

```
SELECT p.product_id, p.product_name, s.supplier_id, s.supplier_name, s.sup_address
FROM dbo.products p
LEFT OUTER JOIN dbo.Supplier_Products sp ON p.product_id = sp.product_id
LEFT OUTER JOIN dbo.supplier s ON sp.supplier_id = s.supplier_id;
```

The query results are displayed in a table with the following data:

product_id	product_name	supplier_id	supplier_name	sup_address
1	iPhone 14 Pro	3	Montreal Innovations	789 Elm Road
2	MacBook Pro M2	2	Vancouver Electronics	456 Oak Avenue
3	iPad Air 5th Gen	3	Montreal Innovations	789 Elm Road
4	Apple Watch Series 7	1	TechCan Solutions	123 Maple Street
5	AirPods Pro	3	Montreal Innovations	789 Elm Road
6	Apple TV 4K	2	Vancouver Electronics	456 Oak Avenue
7	Beats Fit Pro	2	Vancouver Electronics	456 Oak Avenue
8	AirTag	1	TechCan Solutions	123 Maple Street
9	Apple Magic Keyboard	1	TechCan Solutions	123 Maple Street
10	Apple Magic Mouse	1	TechCan Solutions	123 Maple Street
11	Apple Magic Trackpad	3	Montreal Innovations	789 Elm Road

The status bar at the bottom indicates that the query was executed successfully and returned 19 rows.

Inspecting Collections in MongoDB

1. Using find to get all the warehouses with a number of employees greater than 1000.

```
> db.Companies.find({"Number Of Employees":{$gt:1000}})
< {
  _id: ObjectId("64d913f7d9d644e00a815c15"),
  Company_ID: 3,
  Company_Code: 'ABC',
  Company_Name: 'ABC Corporation',
  HQ_Address: '789 Park Avenue, New York, NY 10021',
  Director_Name: 'Bill Smith',
  'Number Of Employees': 2000
}
{
  _id: ObjectId("64d913f7d9d644e00a815c16"),
  Company_ID: 4,
  Company_Code: 'LMN',
  Company_Name: 'LMN Corporation',
  HQ_Address: '1010 Washington Street, Chicago, IL 60602',
  Director_Name: 'Susan Jones',
  'Number Of Employees': 1500
}
{
  _id: ObjectId("64d913f7d9d644e00a815c17"),
  Company_ID: 5,
  Company_Code: 'DEF',
  Company_Name: 'DEF Corporation',
  HQ_Address: '1111 Maple Street, Houston, TX 77002',
  Director_Name: 'Peter Johnson',
  'Number Of Employees': 3000
}
supplychaindb>
```

2. Using find to get the suppliers from Houston.

```
>_MONGOSH
> db.suppliers.find({"City": "Houston"})
< {
  _id: ObjectId("64d90b4ed9d644e00a815c07"),
  Supplier_ID: 5,
  Supplier_Name: 'DEF Enterprises',
  Supplier_Code: 'DEF',
  Address: '1111 Maple Street, Houston, TX 77002',
  Established_Year: 2020,
  Organization_Type: 'LLC',
  City: 'Houston',
  Province: 'TX'
}
supplychaindb> |
```

3. Using projection to get only the names of the products whose prices are greater than 30.

```
> db.products.find({"Price":{$gte:30}},{ "Product_Name": 1,_id:0})
< {
  Product_Name: 'Acme Product 1'
}
{
  Product_Name: 'XYZ Product 2'
}
{
  Product_Name: 'LMN Product 4'
}
{
  Product_Name: 'DEF Product 5'
}
supplychaindb> |
```

4. Using find to get the employees whose ages are less than 30.

```
> db.Employees.find({"Emp_Age":{$lt:30}})
< {
  _id: ObjectId("64d912f3d9d644e00a815c0f"),
  Employee_ID: 2,
  Warehouse_ID: 2,
  Emp_Code: 'XYZ456',
  'Emp_First Name': 'Jane',
  Emp_Last_Name: 'Doe',
  Emp_Age: 25,
  Emp_Contact: 9876543210,
  Emp_Address: '456 Elm Street, Los Angeles, CA 90001',
  Emp_City: 'Los Angeles',
  Emp_Province: 'CA'
}
{
  _id: ObjectId("64d912f3d9d644e00a815c11"),
  Employee_ID: 4,
  Warehouse_ID: 4,
  Emp_Code: 'LMN012',
  'Emp_First Name': 'Susan',
  Emp_Last_Name: 'Jones',
  Emp_Age: 27,
  Emp_Contact: 1111111111,
  Emp_Address: '1010 Washington Street, Chicago, IL 60602',
  Emp_City: 'Chicago',
  Emp_Province: 'IL'
}
supplychaindb> |
```

5. Using `find` to get the warehouses with area greater than 15000 sqm and has a number of employees greater than 350 (using 'and' logical operator)

```
> db.Warehouses.find({$and:[{"Area_in_sqm":{$gt:15000}},{"Number_of_Employees":{$gt:350}}])
< {
  _id: ObjectId("64d90c77d9d644e00a815c0c"),
  Warehouse_ID: 4,
  CDC_ID: 6,
  Company_ID: 7,
  Address: '1010 Washington Street, Chicago, IL 60602',
  Warehouse_Code: 'LMN',
  Area_in_sqm: 25000,
  Number_of_Departments: 20,
  Number_of_Employees: 400,
  Province: 'IL',
  City: 'Chicago'
}
{
  _id: ObjectId("64d90c77d9d644e00a815c0d"),
  Warehouse_ID: 5,
  CDC_ID: 7,
  Company_ID: 8,
  Address: '1111 Maple Street, Houston, TX 77002',
  Warehouse_Code: 'DEF',
  Area_in_sqm: 30000,
  Number_of_Departments: 25,
  Number_of_Employees: 500,
  Province: 'TX',
  City: 'Houston'
}
supplychaindb>
